

1 ABSTRACT OF THE DISCLOSURE

2 The present invention is a new resin chamber construction, a
3 kit and method for the repair of large selection of breaks in a
4 lens or an automobile light bulb housing and even plate glass. The
5 kit and method enable an inexpensive in situ repair including a
6 bead overriding the break substantially maintaining light
7 diffusions patterns. The bead forms an environmentally impervious
8 repair which can match the color of the housing or lens including
9 a substantially matching light diffusion pattern to diffuse light
10 substantially similar to that of the unbroken article. The kit
11 includes parts enclosable in a blister pack. The blister cover may
12 include a resin chamber construction which can be cut out from it.
